SN65HVD23x 3.3V CAN 总线收发器

1 特性

- 由 3.3V 单电源供电
- 符合 ISO 11898-2 标准
- PCA82C250 封装的低功耗替代产品
- 总线引脚静电放电 (ESD) 保护超过 ±16kV 人体模型 (HBM)
- 高输入阻抗，允许一条总线上连接多达 120 个节点
- 可调节的驱动器转换时间，能够改善辐射性能
  - SN65HVD230 和 SN65HVD231
- SN65HVD230：低电流待机模式
  - 370μA（典型值）
- SN65HVD231：超低电流休眠模式
  - 40nA（典型值）
- 针对高达 1Mbps 的数据速率(1) 而设计
- 热关断保护
- 开路故障安全设计
- 针对热插拔 应用的无毛刺脉冲上电和断电保护

(1) 线路的信号传输速率是指每秒钟的电压转换次数，单位为 bps（每秒比特数）。

2 应用

- 工业自动化、控制、传感器和驱动系统
- 电机和机器人控制
- 楼宇和温度控制 (HVAC)
- 电信和基站控制及状态
- 控制器局域网 (CAN) 总线标准，例如 CANopen、DeviceNet 和 CAN Kingdom

3 说明

SN65HVD230、SN65HVD231 和 SN65HVD232 控制器局域网 (CAN) 收发器符合 ISO 11898-2 高速 CAN 物理层标准（收发器）规范。这些器件专为数据速率高达 1Mbps 的应用而设计，而且包括许多保护 特性 来提供器件和 CAN 网络的稳健性。SN65HVD23x 收发器设计为与德州仪器 (TI) 具有 CAN 控制器或等效协议控制器的 3.3V μP、MCU 和 DSP 结合使用。这些器件旨在用于根据 ISO 11898 标准使用 CAN 串行通信物理层的 应用 。

器件信息(1)

器件型号	封装	封装尺寸（标称值）
SN65HVD230	SOIC (8)	4.90mm × 3.91mm
SN65HVD231		
SN65HVD232		

(1) 如需了解所有可用封装，请见数据表末尾的可订购产品附录。

目录

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision N (July 2015) to Revision O — **Page**

- Changed Slope Control Resistance - kW To: Slope Control Resistance - kΩ in Figure 33 ... 22
- Changed Driver Output Signal Slope - V/ms To: Driver Output Signal Slope - V/µs in Figure 33 ... 22

Changes from Revision M (May 2015) to Revision N — **Page**

- 将数据表标题从“SN65HVD230x 3.3V CAN 总线收发器”更改为“SN65HVD23x 3.3V CAN 总线收发器” ... 1

Changes from Revision L (January 2015) to Revision M — **Page**

- Changed Figure 44 title From: "Layout Example Schematic" To: "SN65HVD23x Board Layout" ... 34

Changes from Revision K (February 2011) to Revision L — **Page**

- 已添加 *引脚配置和功能* 部分、*ESD 额定值* 表、*特性* *说明* 部分、*器件功能模式*、*应用和实施* 部分、*电源建议* 部分、*布局* 部分、*器件和文档支持* 部分，以及*机械、封装和可订购信息* 部分 ... 1
- 更改了 特性、 应用和 说明列表 ... 1
- Added THERMAL SHUTDOWN TEMPERATURE AND HYSTERESIS in the Recommended Operating Conditions table . 6
- Added the THERMAL SHUTDOWN paragraph to the Application Information section ... 20
- Added Figure 34 and Figure 35 ... 25
- Added the CAN TERMINATION paragraph to the Application Information section ... 26
- Added the BUS LOADING, LENGTH AND NUMBER OF NODES paragraph to the Application Information section ... 28

Changes from Revision J (January 2009) to Revision K **Page**

- Replaced the DISSIPATION RATING TABLE with the Thermal Information table 6

Changes from Revision I (October 2007) to Revision J **Page**

- Deleted Low-to-High Propagation Delay Time vs Common-Mode Input Voltage Characteristics 12
- Deleted Driver Schematic Diagram 12
- Added Figure 38 32

5 说明（续）

这些器件可在极其恶劣的环境下工作，具有串线保护、接地失效和过压保护、过热保护以及宽共模工作范围等特性。

CAN 收发器属于 CAN 物理层器件，用于连接单端主机 CAN 协议控制器和工业、楼宇自动化和汽车 应用中的差分 CAN 总线。这些器件在总线上工作于 -2V 至 7V 共模电压范围内，并且能够承受 ±25V 的共模瞬态电压。

SN65HVD230 和 SN65HVD231 通过 R_S 引脚（引脚 8）提供三种不同的工作模式：高速模式、斜率控制模式和低功耗模式。将 R_S 引脚接地可选择高速工作模式，该工作模式允许发送器输出晶体管以尽可能快的速度导通和关断，而且对上升和下降斜率没有限制。另外，可通过在 R_S 引脚与地之间串联一个电阻来调节上升和下降斜率。斜率将与引脚的输出电流成比例。当电阻值为 10kΩ 时，器件的压摆率约为 15V/μs；当电阻值为 100kΩ 时，器件的压摆率约为 2V/μs。更多信息，请参见*应用信息*。

如果对 R_S 引脚施加逻辑高电平，SN65HVD230 将进入低电流待机模式（仅监听）。在此模式下，驱动器将关断，接收器保持工作状态。相比正常模式，该模式的功耗更低，同时仍允许 CAN 控制器监视总线活动以确定是否应使收发器恢复正常模式或斜率控制模式。当器件要向总线发送消息或者器件在待机模式下接收到需要再次准备就绪以进行发送的总线指示时，主机控制器（MCU、DSP）会将器件恢复为发送模式（高速模式或斜率控制模式）。

SN65HVD230 与 SN65HVD231 的区别在于：当对 R_S 引脚施加逻辑高电平时，SN65HVD231 中的驱动器和接收器均关断。在这种休眠模式下，器件与总线之间将无法进行通信。在通过对 R_S 引脚施加逻辑低电平以重新激活器件之前，器件将始终保持休眠模式。

6 Device Comparison Table

PART NUMBER(1)	LOW POWER MODE	INTEGRATED SLOPE CONTROL	V_{ref} PIN	T_A	MARKED AS:
SN65HVD230	Standby mode	Yes	Yes	40°C to 85°C	VP230
SN65HVD231	Sleep mode	Yes	Yes		VP231
SN65HVD232	No standby or sleep mode	No	No		VP232

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
D	1	I	CAN transmit data input (LOW for dominant and HIGH for recessive bus states), also called TXD, driver input
GND	2	GND	Ground connection
V_{CC}	3	Supply	Transceiver 3.3V supply voltage
R	4	O	CAN receive data output (LOW for dominant and HIGH for recessive bus states), also called RXD, receiver output
V_{ref}	5	O	SN65HVD230 and SN65HVD231: V_{CC} / 2 reference output pin
NC		NC	SN65HVD232: No Connect
CANL	6	I/O	Low level CAN bus line
CANH	7	I/O	High level CAN bus line
R_S	8	I	SN65HVD230 and SN65HVD231: Mode select pin: strong pull down to GND = high speed mode, strong pull up to V_{CC} = low power mode, 10kΩ to 100kΩ pull down to GND = slope control mode
NC		I	SN65HVD232: No Connect

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)(2)

	MIN	MAX	UNIT
Supply voltage, V_{CC}	–0.3	6	V
Voltage at any bus terminal (CANH or CANL)	–4	16	V
Voltage input, transient pulse, CANH and CANL, through 100 Ω (see Figure 24)	–25	25	V
Digital Input and Output voltage, V_I (D or R)	–0.5	V_{CC} + 0.5	V
Receiver output current, I_O	–11	11	mA
Continuous total power dissipation	See *Thermal Information*		
Storage temperature, T_{stg}	–40	85	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values, except differential I/O bus voltages, are with respect to network ground terminal.

8.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	CANH, CANL and GND	±16000	V
			All pins	±4000	
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]		±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
Supply voltage, V_{CC}		3		3.6	V
Voltage at any bus terminal (common mode) V_{IC}		–2[1]		7	V
Voltage at any bus terminal (separately) V_I		–2.5		7.5	V
High-level input voltage, V_{IH}	D, R	2			V
Low-level input voltage, V_{IL}	D, R			0.8	V
Differential input voltage, V_{ID} (see Figure 22)		–6		6	V
Input voltage, $V_{(Rs)}$		0		V_{CC}	V
Input voltage for standby or sleep, $V_{(Rs)}$		0.75 V_{CC}		V_{CC}	V
Wave-shaping resistance, Rs		0		100	kΩ
High-level output current, I_{OH}	Driver	–40			mA
	Receiver	–8			
Low-level output current, I_{OL}	Driver			48	mA
	Receiver			8	
Thermal shutdown temperature			165		°C
Thermal shutdown hysteresis			10		
Operating free-air temperature, T_A		–40		85	

(1) The algebraic convention, in which the least positive (most negative) limit is designated as minimum is used in this data sheet.

8.4 Thermal Information

THERMAL METRIC[1]		SN65HVD230	SN65HVD231	SN65HVD232	UNIT
		D			
		8 PINS			
$R_{\theta JA}$	Junction-to-ambient thermal resistance	76.8	101.5	101.5	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	33.4	43.3	43.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	15.3	42.2	42.4	°C/W
ψ_{JT}	Junction-to-top characterization parameter	1.4	4.8	4.8	°C/W
ψ_{JB}	Junction-to-board characterization parameter	14.9	41.8	41.8	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

8.5 Electrical Characteristics: Driver

over recommended operating conditions (unless otherwise noted)

PARAMETER				TEST CONDITIONS		MIN	TYP(1)	MAX	UNIT
V_{OH}	Bus output voltage	Dominant		V_I = 0 V, See Figure 18 and Figure 20	CANH	2.45		V_{CC}	V
					CANL	0.5		1.25	
V_{OL}		Recessive		V_I = 3 V, See Figure 18 and Figure 20	CANH		2.3		
					CANL		2.3		
$V_{OD(D)}$	Differential output voltage	Dominant		V_I = 0 V, See Figure 18		1.5	2	3	V
				V_I = 0 V, See Figure 19		1.2	2	3	
$V_{OD(R)}$		Recessive		V_I = 3 V, See Figure 18		–120	0	12	mV
				V_I = 3 V, No load		–0.5	–0.2	0.05	V
I_{IH}	High-level input current			V_I = 2 V		–30			µA
I_{IL}	Low-level input current			V_I = 0.8 V		–30			µA
I_{OS}	Short-circuit output current			V_{CANH} = -2 V		–250		250	mA
				V_{CANL} = 7 V		–250		250	
C_o	Output capacitance			See receiver					
I_{CC}	Supply current	Standby	SN65HVD230	$V_{(Rs)}$ = V_{CC}			370	600	µA
		Sleep	SN65HVD231	$V_{(Rs)}$ = V_{CC}, D at V_{CC}			0.04	1	
		All devices	Dominant	V_I = 0 V, No load	Dominant		10	17	mA
			Recessive	V_I = V_{CC}, No load	Recessive		10	17	

(1) All typical values are at 25°C and with a 3.3-V supply.

8.6 Electrical Characteristics: Receiver

over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP(1)	MAX	UNIT
V_{IT+}	Positive-going input threshold voltage	See Table 1			750	900	mV
V_{IT-}	Negative-going input threshold voltage			500	650		mV
V_{hys}	Hysteresis voltage (V_{IT+} – $V_{IT–}$)				100		
V_{OH}	High-level output voltage	–6 V ≤ V_{ID} ≤ 500 mV, I_O = –8 mA, See Figure 22		2.4			V
V_{OL}	Low-level output voltage	900 mV ≤ V_{ID} ≤ 6 V, I_O = 8 mA, See Figure 22				0.4	
I_I	Bus input current	V_{IH} = 7 V	Other input at 0 V, D = 3 V	100		250	µA
		V_{IH} = 7 V, V_{CC} = 0 V		100		350	
		V_{IH} = -2 V		–200		–30	µA
		V_{IH} = -2 V, V_{CC} = 0 V		–100		–20	
C_I	CANH, CANL input capacitance	Pin-to-ground, V_I = 0.4 sin(4E6πt) + 0.5 V	$V_{(D)}$ = 3 V,		32		pF
C_{Diff}	Differential input capacitance	Pin-to-pin, V_I = 0.4 sin(4E6πt) + 0.5 V	$V_{(D)}$ = 3 V,		16		pF
R_{Diff}	Differential input resistance	Pin-to-pin, $V_{(D)}$ = 3 V		40	70	100	kΩ
R_I	CANH, CANL input resistance			20	35	50	kΩ
I_{CC}	Supply current	See driver					

(1) All typical values are at 25°C and with a 3.3-V supply.

8.7 Switching Characteristics: Driver

over recommended operating conditions (unless otherwise noted)

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
SN65HVD230 AND SN65HVD231							
t_{PLH}	Propagation delay time, low-to-high-level output	$V_{(Rs)}$ = 0 V	C_L = 50 pF, See Figure 21		35	85	ns
		R_S with 10 kΩ to ground			70	125	
		R_S with 100 kΩ to ground			500	870

10 Detailed Description

10.1 Overview

ISO 11898 family of standards are the international standard for high speed serial communication using the controller area network (CAN) bus protocol and physical layers (transceivers). It supports multimaster operation, real time control, programmable data rates up to 1 Mbps, and powerful redundant error checking procedures that provide reliable data transmission. It is suited for networking *intelligent* devices as well as sensors and actuators within the rugged electrical environment of a machine chassis or factory floor. The SN65HVD23x family of 3.3 V CAN transceivers implement the lowest layers of the ISO/OSI reference model, the ISO11898-2 standard. This is the interface with the physical signaling output of the CAN controller of the Texas Instruments µPs, MCUs and DSPs, such as TMS320Lx240x 3.3 V DSPs, as illustrated in Figure 28.

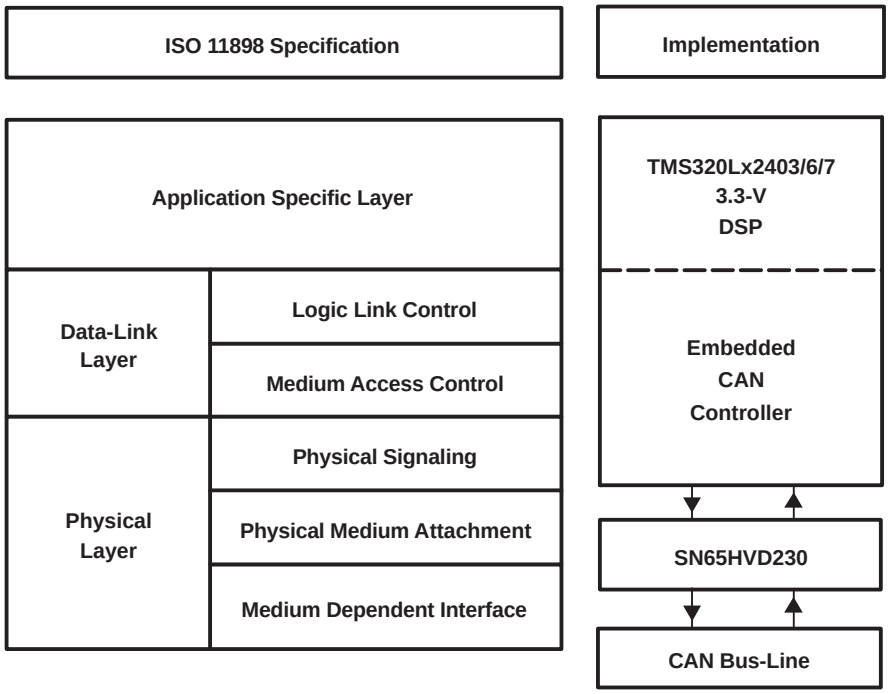

Figure 28. Layered ISO 11898 Standard Architecture

10.2 Functional Block Diagram

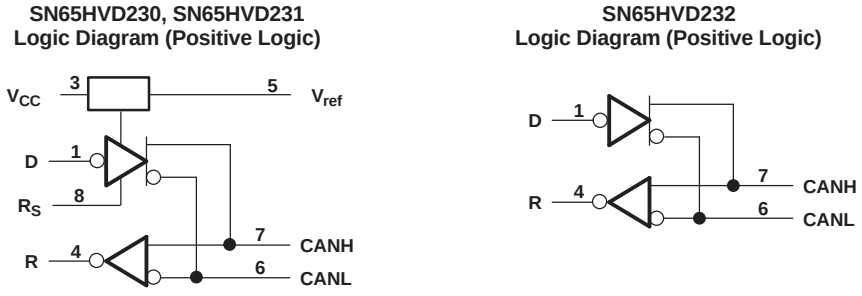

Figure 29. Logic Diagram (Positive Logic)

10.3 Feature Description

The SN65HVD230/231/232 are pin-compatible (but not functionally identical) with one another and, depending upon the application, may be used with identical circuit boards.

These transceivers feature single 3.3 V supply operation and standard compatibility with signaling rates up to 1 Mbps, ±16 kV HBM ESD protection on the bus pins, thermal shutdown protection, bus fault protection, and open-circuit receiver failsafe. The fail-safe design of the receiver assures a logic high at the receiver output if the bus wires become open circuited.

The bus pins are also maintained in a high-impedance state during low V_{CC} conditions to ensure glitch-free power-up and power-down bus protection for hot-plugging applications. This high-impedance condition also means that an unpowered node does not disturb the bus. Transceivers without this feature usually have a very low output impedance. This results in a high current demand when the transceiver is unpowered, a condition that could affect the entire bus.

10.3.1 V_{ref} Voltage Reference

The V_{ref} pin (pin 5) on the SN65HVD230 and SN65HVD231 is available as a $V_{CC}/2$ voltage reference. This pin can be connected to the common mode point of a split termination to help further stabilize the common mode voltage of the bus. If the V_{ref} pin is not used it may be left floating.

10.3.2 Thermal Shutdown

If a high ambient temperature or excessive output currents result in thermal shutdown, the driver will be disabled and the bus pins become high impedance. During thermal shutdown the D pin to bus transmission path is blocked and the CAN bus pins are high impedance and biased to a recessive level. Once the thermal shutdown condition is cleared and the junction temperature drops below the thermal shutdown temperature the driver will be reactivated and resume normal operation. During a thermal shutdown the receiver to R pin path remains operational.

10.4 Device Functional Modes

The R_S pin (Pin 8) of the SN65HVD230 and SN65HVD231 provides three different modes of operation: high-speed mode, slope-control mode, and low-power mode.

10.4.1 High-Speed Mode

The high-speed mode can be selected by applying a logic low to the R_S pin (pin 8). The high-speed mode of operation is commonly employed in industrial applications. High-speed allows the output to switch as fast as possible with no internal limitation on the output rise and fall slopes. If the high speed transitions are a concern for emissions performance slope control mode can be used.

If both high speed mode and the low-power standby mode is to be used in the application, direct connection to a µP, MCU or DSP general purpose output pin can be used to switch between a logic-low level (< 1.2 V) for high speed operation, and the logic-high level (> 0.75 V_{CC}) for standby. Figure 30 shows a typical DSP connection, and Figure 31 shows the HVD230 driver output signal in high-speed mode on the CAN bus.

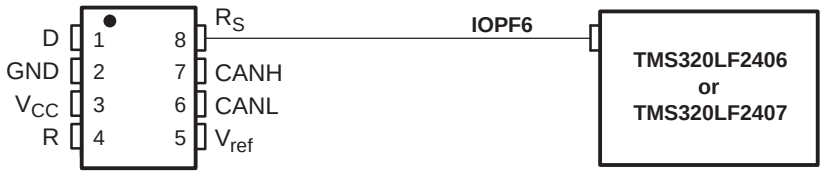

Figure 30. R_S (Pin 8) Connection to a TMS320LF2406/07 for High Speed/Standby Operation

Device Functional Modes (continued)

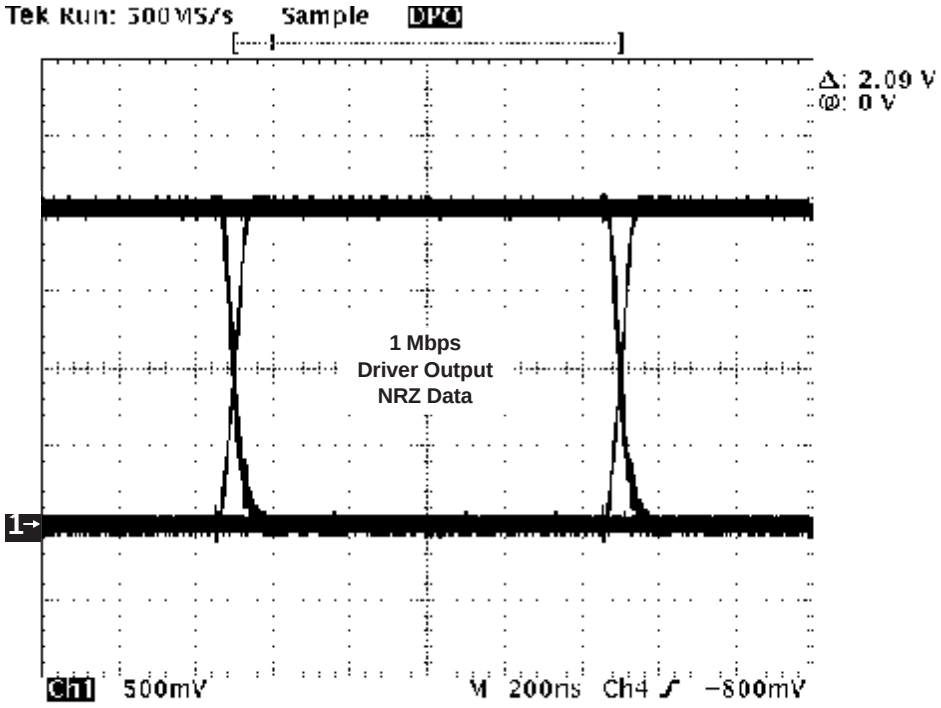

Figure 31. Typical High Speed SN65HVD230 Output Waveform into a 60-Ω Load

10.4.2 Slope Control Mode

Electromagnetic compatibility is essential in many applications while still making use of unshielded twisted pair bus cable to reduce system cost. Slope control mode was added to the SN65HVD230 and SN65HVD231 devices to reduce the electromagnetic interference produced by the rise and fall times of the driver and resulting harmonics. These rise and fall slopes of the driver outputs can be adjusted by connecting a resistor from R_S (pin 8) to ground or to a logic low voltage, as shown in Figure 32. The slope of the driver output signal is proportional to the pin's output current. This slope control is implemented with an external resistor value of 10 kΩ to achieve a ~15 V/μs slew rate, and up to 100 kΩ to achieve a ~2.0 V/μs slew rate as displayed in Figure 33.

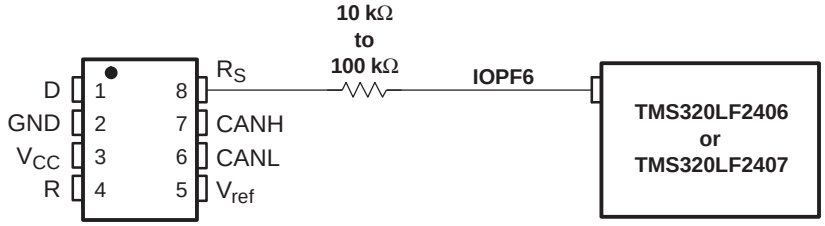

Figure 32. Slope Control/Standby Connection to a DSP

Device Functional Modes (continued)

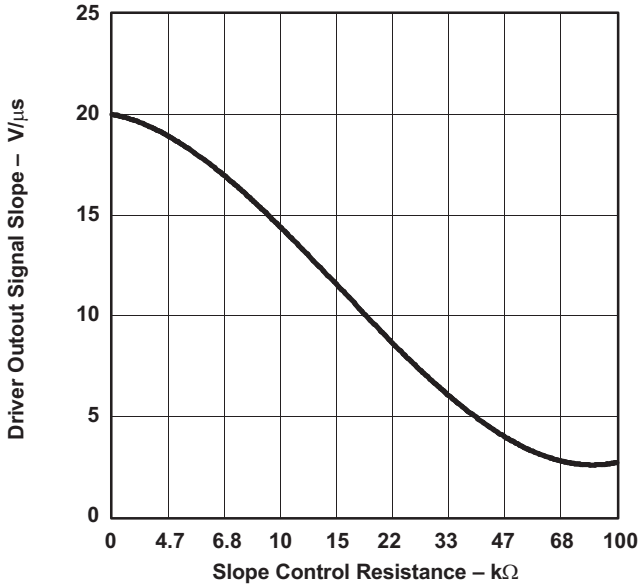

Figure 33. HVD230 Driver Output Signal Slope vs Slope Control Resistance Value

10.4.3 Standby Mode (Listen Only Mode) of the HVD230

If a logic high (> 0.75 V_{CC}) is applied to R_S (pin 8) in Figure 30 and Figure 32, the circuit of the SN65HVD230 enters a low-current, *listen only* standby mode, during which the driver is switched off and the receiver remains active. In this *listen only* state, the transceiver is completely passive to the bus. It makes no difference if a slope control resistor is in place as shown in Figure 32. The µP can reverse this low-power standby mode when the rising edge of a dominant state (bus differential voltage > 900 mV typical) occurs on the bus. The µP, sensing bus activity, reactivates the driver circuit by placing a logic low (< 1.2 V) on R_S (pin 8).

10.4.4 The Babbling Idiot Protection of the HVD230

Occasionally, a runaway CAN controller unintentionally sends messages that completely tie up the bus (what is referred to in CAN jargon as a babbling idiot). When this occurs, the µP, MCU or DSP can engage the *listen-only* standby mode of the transceiver to disable the driver and release the bus, even when access to the CAN controller has been lost. When the driver circuit is deactivated, its outputs default to a high-impedance state (recessive).

10.4.5 Sleep Mode of the HVD231

The unique difference between the SN65HVD230 and the SN65HVD231 is that both driver and receiver are switched off in the SN65HVD231 when a logic high is applied to R_S (pin 8). The device remains in a very low power-sleep mode until the circuit is reactivated with a logic low applied to R_S (pin 8). While in this sleep mode, the bus-pins are in a high-impedance state, while the D and R pins default to a logic high.

10.4.6 Summary of Device Operating Modes

Table 2 shows a summary of the operating modes for the SN65HVD230 and SN65HVD231. Please note that the SN65HVD232 is a basic CAN transceiver has only the normal high speed mode of operation; pins 5 and 8 are no connection (NC).

Device Functional Modes (continued)

Table 2. SN65HVD230 and SN65HVD231 Operating Modes

R_S Pin	MODE		DRIVER	RECEIVER	RXD Pin
LOW, $V_{(Rs)}$ < 1.2 V, strong pull down to GND	High Speed Mode		Enabled (ON) High Speed	Enabled (ON)	Mirrors Bus State(1)
LOW, $V_{(Rs)}$ < 1.2 V, 10 kΩ to 100 kΩ pull down to GND	Slope Control Mode		Enabled (ON) with Slope Control	Enabled (ON)	Mirrors Bus State
HIGH, $V_{(Rs)}$ > 0.75 V_{CC}	Low Current Mode	SN65HVD230: Standby Mode	Disabled (OFF)	Enabled (ON)	Mirrors Bus State
		SN65HVD231: Sleep Mode		Disabled (OFF)	High

(1) Mirrors bus state: low if CAN bus is dominant, high if CAN bus is recessive.

11 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

11.1 Application Information

This application section provides information concerning the implementation of the physical medium attachment layer in a CAN network according to the ISO 11898 standard. It presents a typical application circuit and test results, as well as discussions on slope control, total loop delay, and interoperability in 5-V CAN systems.

11.1.1 CAN Bus States

The CAN bus has two states during powered operation of the device; *dominant* and *recessive*. A dominant bus state is when the bus is driven differentially, corresponding to a logic low on the D and R pin. A recessive bus state is when the bus is biased to V_{CC} / 2 via the high-resistance internal resistors R_I and R_{Diff} of the receiver, corresponding to a logic high on the D and R pins. See Figure 34 and Figure 35.

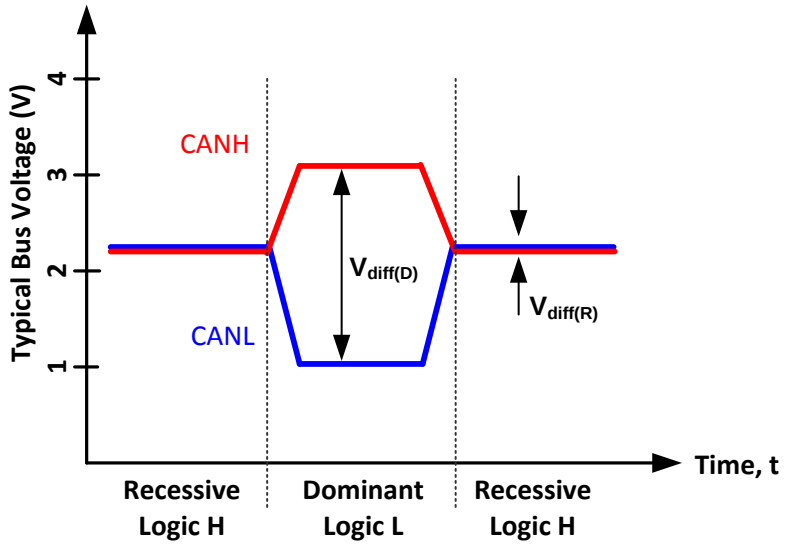

Figure 34. CAN Bus States (Physical Bit Representation)

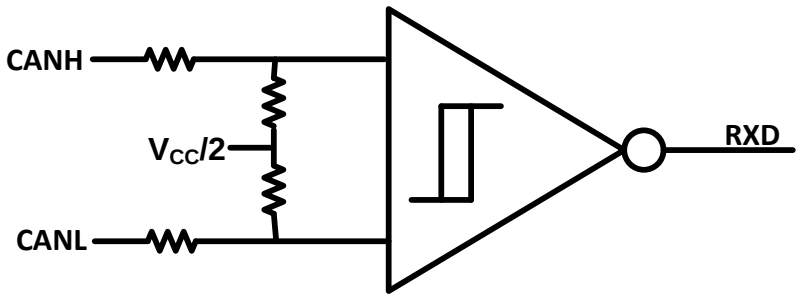

Figure 35. Simplified Recessive Common Mode Bias and Receiver

11.2 Typical Application

Figure 36 illustrates a typical application of the SN65HVD23x family. The output of the host µP's CAN controller (TXD) is connected to the transceivers driver input, pin D, and the transceivers receiver output, pin R, is connected to the input of the CAN controller (RXD). The transceiver is attached to the differential bus lines at pins CANH and CANL. Typically, the bus is a twisted pair of wires with a characteristic impedance of 120 Ω, in the standard half-duplex multipoint topology of Figure 37. Each end of the bus is terminated with 120 Ω resistors in compliance with the standard to minimize signal reflections on the bus.

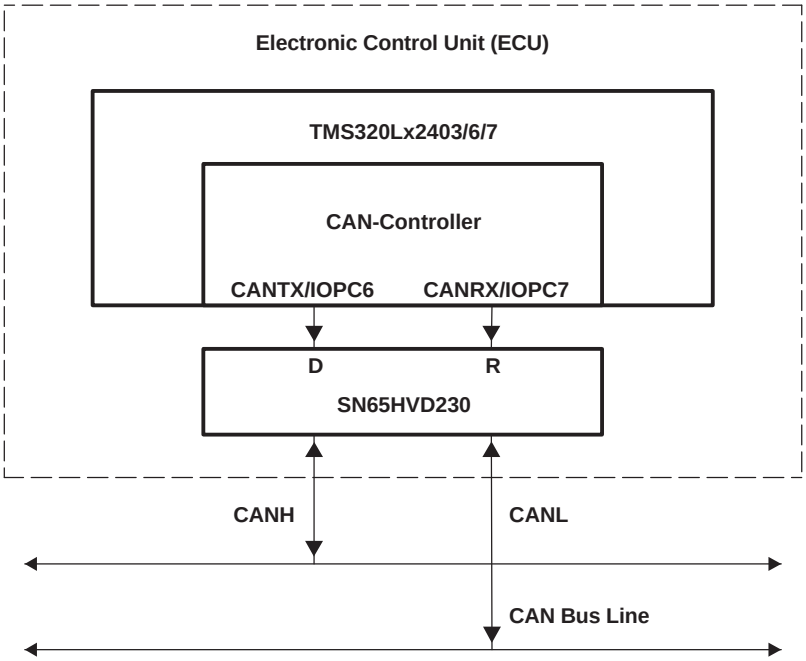

Figure 36. Details of a Typical CAN Node

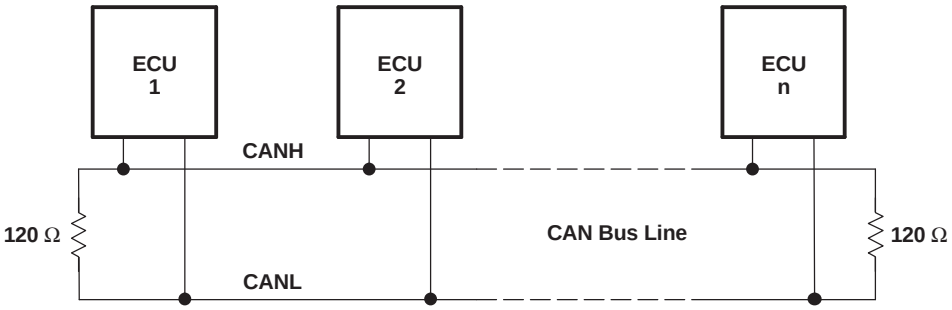

Figure 37. Typical CAN Network

11.2.1 Design Requirements

11.2.1.1 CAN Termination

The ISO11898 standard specifies the interconnect to be a single twisted pair cable (shielded or unshielded) with 120 Ω characteristic impedance (Z_O). Resistors equal to the characteristic impedance of the line should be used to terminate both ends of the cable to prevent signal reflections. Unterminated drop lines (stubs) connecting nodes to the bus should be kept as short as possible to minimize signal reflections. The termination may be on the cable or in a node, but if nodes may be removed from the bus the termination must be carefully placed so that it is not removed from the bus.

Typical Application (continued)

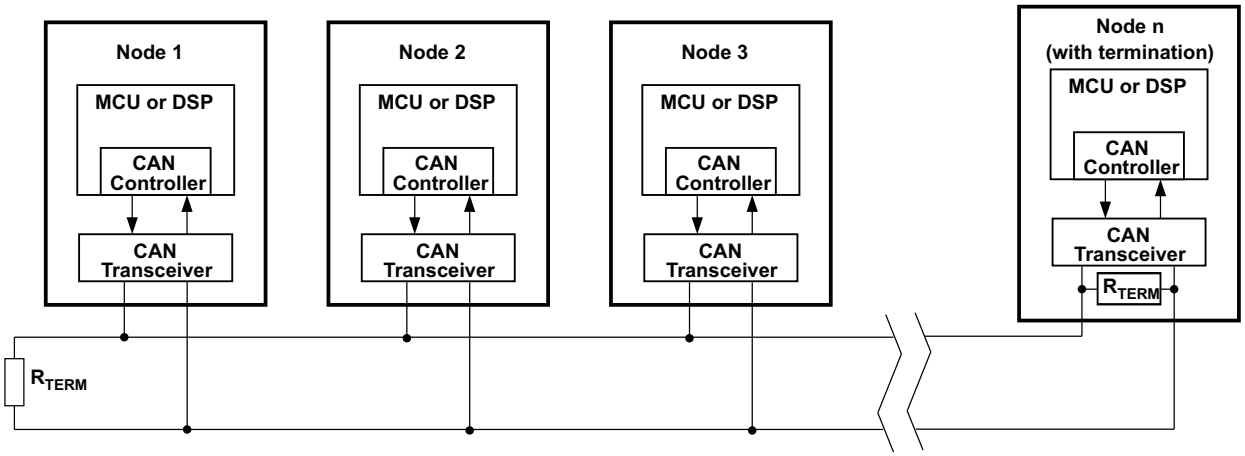

Figure 38. Typical CAN Bus

Termination is typically a 120 Ω resistor at each end of the bus. If filtering and stabilization of the common mode voltage of the bus is desired, then split termination may be used (see Figure 39). Split termination utilizes two 60Ω resistors with a capacitor in the middle of these resistors to ground. Split termination improves the electromagnetic emissions behavior of the network by eliminating fluctuations in the bus common mode voltages at the start and end of message transmissions.

Care should be taken in the power ratings of the termination resistors used. Typically the worst case condition would be if the system power supply was shorted across the termination resistance to ground. In most cases the current flow through the resistor in this condition would be much higher than the transceiver's current limit.

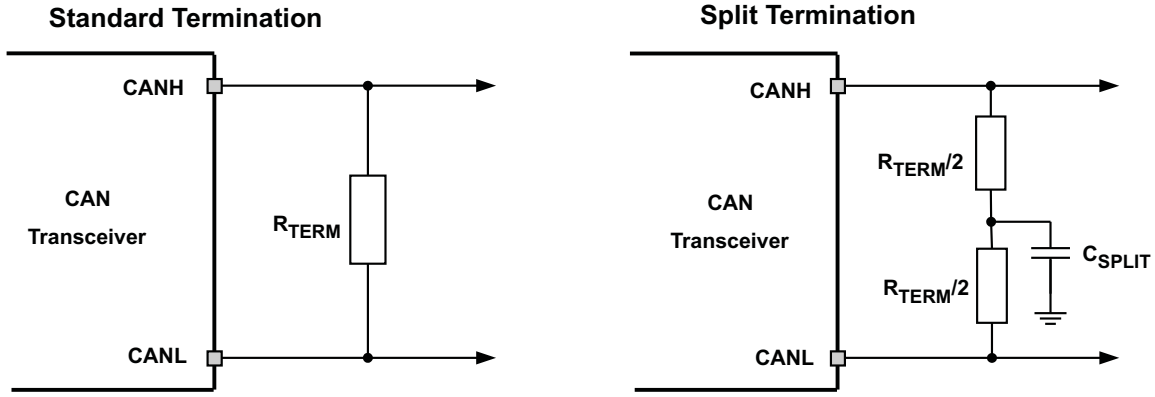

Figure 39. CAN Bus Termination Concepts

11.2.1.2 Loop Propagation Delay

Transceiver loop delay is a measure of the overall device propagation delay, consisting of the delay from the driver input (D pin) to the differential outputs (CANH and CANL pins), plus the delay from the receiver inputs (CANH and CANL) to its output (R pin).

Typical Application (continued)

A typical loop delay for the SN65HVD230 transceiver is displayed in Figure 40. This loop delay will increase as the slope of the driver output is slowed during slope control mode. This increased loop delay means that there is a tradeoff between the total bus length able to be used and the driver's output slope used via the slope control pin of the device. For example, the loop delay for a 10-kΩ resistor from the R_S pin to ground is ~100 ns, and the loop delay for a 100-kΩ resistor is ~500 ns. Therefore, if we use the following rule-of-thumb that the propagation delay of typical twisted pair bus cable is 5 ns/m, we can calculate an approximate cable length trade-off between normal high-speed mode and slope control mode with a 100-kΩ resistor. Using typical values, the loop delay for a recessive to dominant bit with R_S tied directly to ground is 70ns, and with a 100-kΩ resistor is 535 ns. At 5ns/m of propagation delay, which you have to count in both directions the difference is 46.5 meters (535-70)/(2*5).

Another option to improving the elctromagnetic emissions of the device besides slowing down the edge rates of the driver in slope control mode is using quality shielded bus cabling.

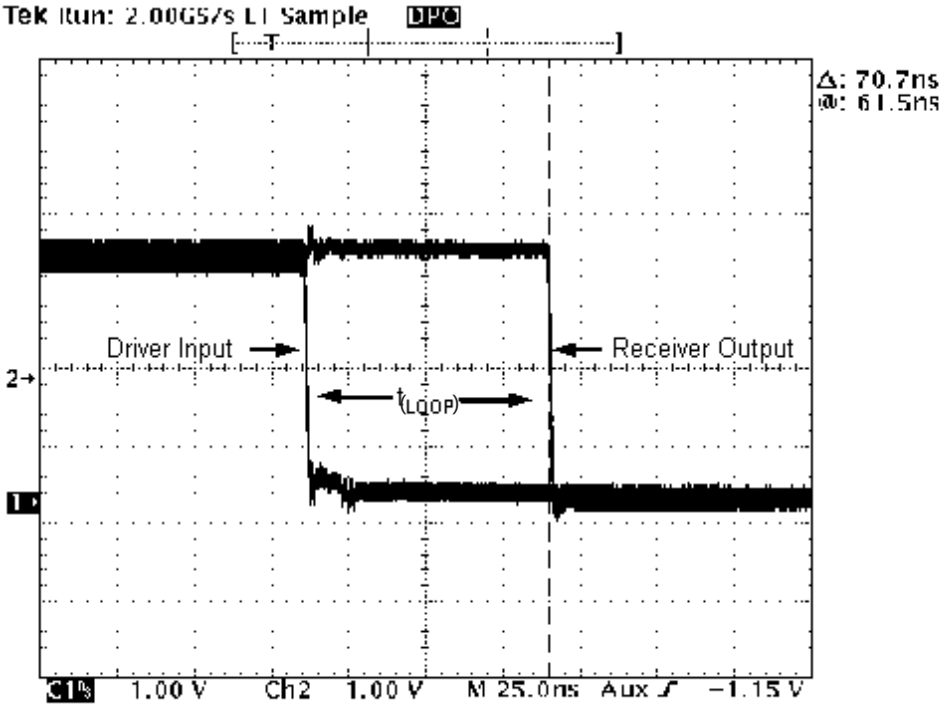

Figure 40. 70.7-ns Loop Delay Through the HVD230 With R_S = 0

11.2.1.3 Bus Loading, Length and Number of Nodes

The ISO11898 Standard specifies up to 1 Mbps data rate, maximum bus length of 40 meters, maximum drop line (stub) length of 0.3 meters and a maximum of 30 nodes. However, with careful network design, the system may have longer cables, longer stub lengths, and many more nodes. Many CAN organizations and standards have scaled the use of CAN for applications outside the original ISO11898 standard. They have made system level trade-offs for data rate, cable length, and parasitic loading of the bus. Examples of some of these specifications are ARINC825, CANopen, CAN Kingdom, DeviceNet and NMEA200.

A high number of nodes requires a transceiver with high input impedance and wide common mode range such as the SN65HVD23x CAN family. ISO11898-2 specifies the driver differential output with a 60 Ω load (two 120 Ω termination resistors in parallel) and the differential output must be greater than 1.5 V. The SN65HVD23x devices are specified to meet the 1.5 V requirement with a 60 Ω load, and additionally specified with a differential output voltage minimum of 1.2 V across a common mode range of –2 V to 7 V via a 167 Ω coupling network. This network represents the bus loading of 120 SN65HVD23x transceivers based on their minimum differential input resistance of 40 kΩ. Therefore, the SN65HVD23x supports up to 120 transceivers on a single bus segment with margin to the 1.2 V minimum differential input voltage requirement at each node. For CAN network design,

Typical Application (continued)

margin must be given for signal loss across the system and cabling, parasitic loadings, network imbalances, ground offsets and signal integrity thus a practical maximum number of nodes may be lower. Bus length may also be extended beyond the original ISO11898 standard of 40 meters by careful system design and data rate tradeoffs. For example, CANopen network design guidelines allow the network to be up to 1 km with changes in the termination resistance, cabling, less than 64 nodes and significantly lowered data rate.

This flexibility in CAN network design is one of the key strengths of the various extensions and additional standards that have been built on the original ISO11898 CAN standard. In using this flexibility comes the responsibility of good network design.

11.2.2 Detailed Design Procedure

The following system level considerations should be looked at when designing your application. There are trade-offs between the total number of nodes, the length of the bus, and the slope of the driver output that need to be evaluated when building up a system

11.2.2.1 Transient Protection

Typical applications that use CAN will sometime require some form of ESD, burst, or surge protection performance at the system level. If these requirements are higher than those of the device some form of external protection may be needed to shield the transceiver against these high power transients that can cause damage. Transient voltage suppressor (TVS) are very commonly used and can help clamp the amount of energy that reaches the transceiver.

11.2.2.2 Transient Voltage Suppressors

Transient voltage suppressors are the preferred protection components for CAN bus applications due to their low capacitance, fast response times and high peak power dissipation limits. The low bus capacitance allows these devices to be used at many, if not all, nodes on the network without having to reduce the data rate. The quick response times in the order of a few picoseconds enable these devices to clamp the energy of very fast transients like ESD and EFT. Lastly, the high peak power ratings enable these devices to handle high energy surge pulses without being damaged.

11.2.3 Application Curve

Typical driver output waveforms from a pulse input signal with different slope control resistances are displayed in Figure 41. The top waveform show the typical differential signal when transitioning from a recessive level to a dominant level on the CAN bus with RS tied to GND through a zero ohm resistor. The second waveform shows the same signal for the condition with a 10k ohm resistor tied from R_S to ground. The bottom waveform shows the typical differential signal for the case where a 100k ohm resistor is tied from the R_S pin to ground.

Typical Application (continued)

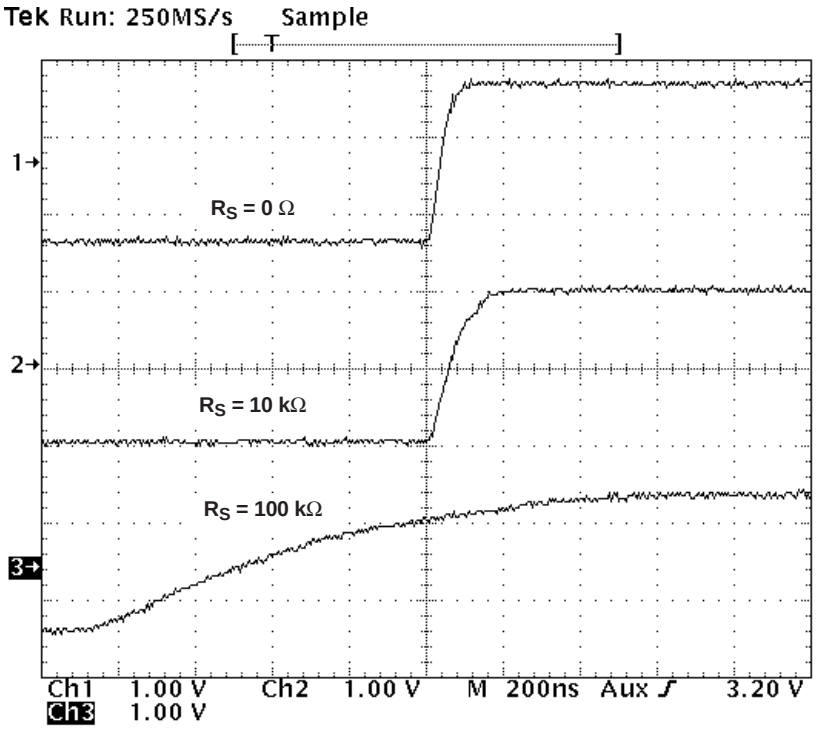

Figure 41. Typical SN65HVD230 250-kbps Output Pulse Waveforms With Slope Control

11.3 System Example

11.3.1 ISO 11898 Compliance of SN65HVD23x Family of 3.3 V CAN Transceivers

11.3.1.1 Introduction

Many users value the low power consumption of operating their CAN transceivers from a 3.3 V supply. However, some are concerned about the interoperability with 5 V supplied transceivers on the same bus. This report analyzes this situation to address those concerns.

11.3.1.2 Differential Signal

CAN is a differential bus where complementary signals are sent over two wires and the voltage difference between the two wires defines the logical state of the bus. The differential CAN receiver monitors this voltage difference and outputs the bus state with a single-ended output signal.

System Example (continued)

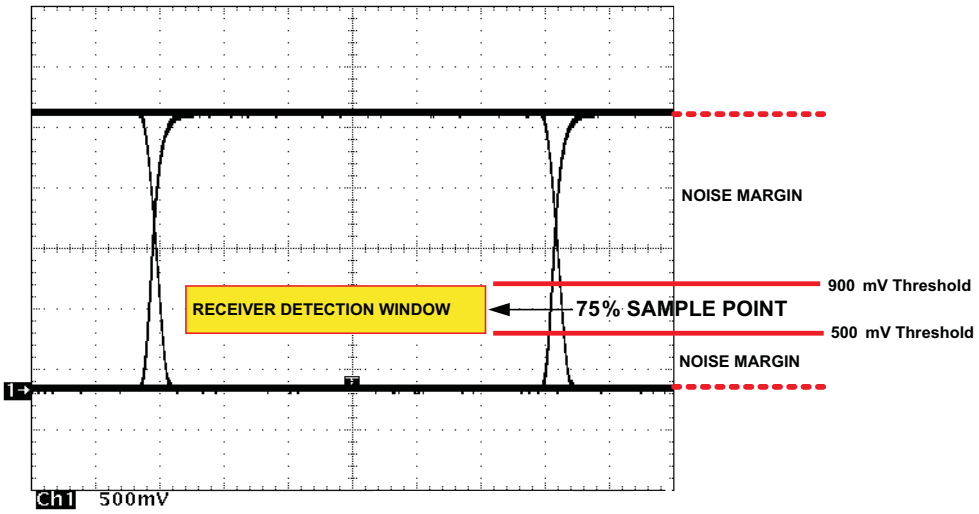

Figure 42. Typical SN65HVD230 Differential Output Voltage Waveform

The CAN driver creates the differential voltage between CANH and CANL in the dominant state. The dominant differential output of the SN65HVD23x is greater than 1.5 V and less than 3 V across a 60 ohm load as defined by the ISO 11898 standard. These are the same limiting values for 5 V supplied CAN transceivers. Typically, the bus termination resistors drive the bus back to the recessive bus state and not the CAN driver.

A CAN receiver is required to output a recessive state when less than 500 mV of differential voltage exists on the bus, and a dominant state when more than 900 mV of differential voltage exists on the bus. The CAN receiver must do this with common-mode input voltages from -2 V to 7 volts per the ISO 11898-2 standard. The SN65HVD23x family receivers meet these same input specifications as 5 V supplied receivers.

11.3.1.2.1 Common Mode Signal

A common-mode signal is an average voltage of the two signal wires that the differential receiver rejects. The common-mode signal comes from the CAN driver, ground noise, and coupled bus noise. Since the bias voltage of the recessive state of the device is dependent on V_{CC}, any noise present or variation of V_{CC} will have an effect on this bias voltage seen by the bus. The SN65HVD23x family has the recessive bias voltage set higher than $0.5*V_{CC}$ to comply with the ISO 11898-2 CAN standard which states that the recessive bias voltage must be between 2 V and 3 V. The caveat to this is that the common mode voltage will drop by a couple hundred millivolts when driving a dominant bit on the bus. This means that there is a common mode shift between the dominant bit and recessive bit states of the device. While this is not ideal, this small variation in the driver common-mode output is rejected by differential receivers and does not effect data, signal noise margins or error rates.

11.3.1.3 Interoperability of 3.3-V CAN in 5-V CAN Systems

The 3.3 V supplied SN65HVD23x family of CAN transceivers are fully compatible with 5 V CAN transceivers. The differential output voltage is the same, the recessive common mode output bias is the same, and the receivers have the same input specifications. The only difference is in the dominant common mode output voltage is lower in 3.3 V CAN transceivers than with 5 V supplied transceiver (by a few hundred millivolts).

To help ensure the widest interoperability possible, the SN65HVD23x family has successfully passed the internationally recognized GIFT ICT conformance and interoperability testing for CAN transceivers which is shown in . Electrical interoperability does not always assure interchangeability however. Most implementers of CAN buses recognize that ISO 11898 does not sufficiently specify the electrical layer and that strict standard compliance alone does not ensure full interchangeability. This comes only with thorough equipment testing.

System Example (continued)

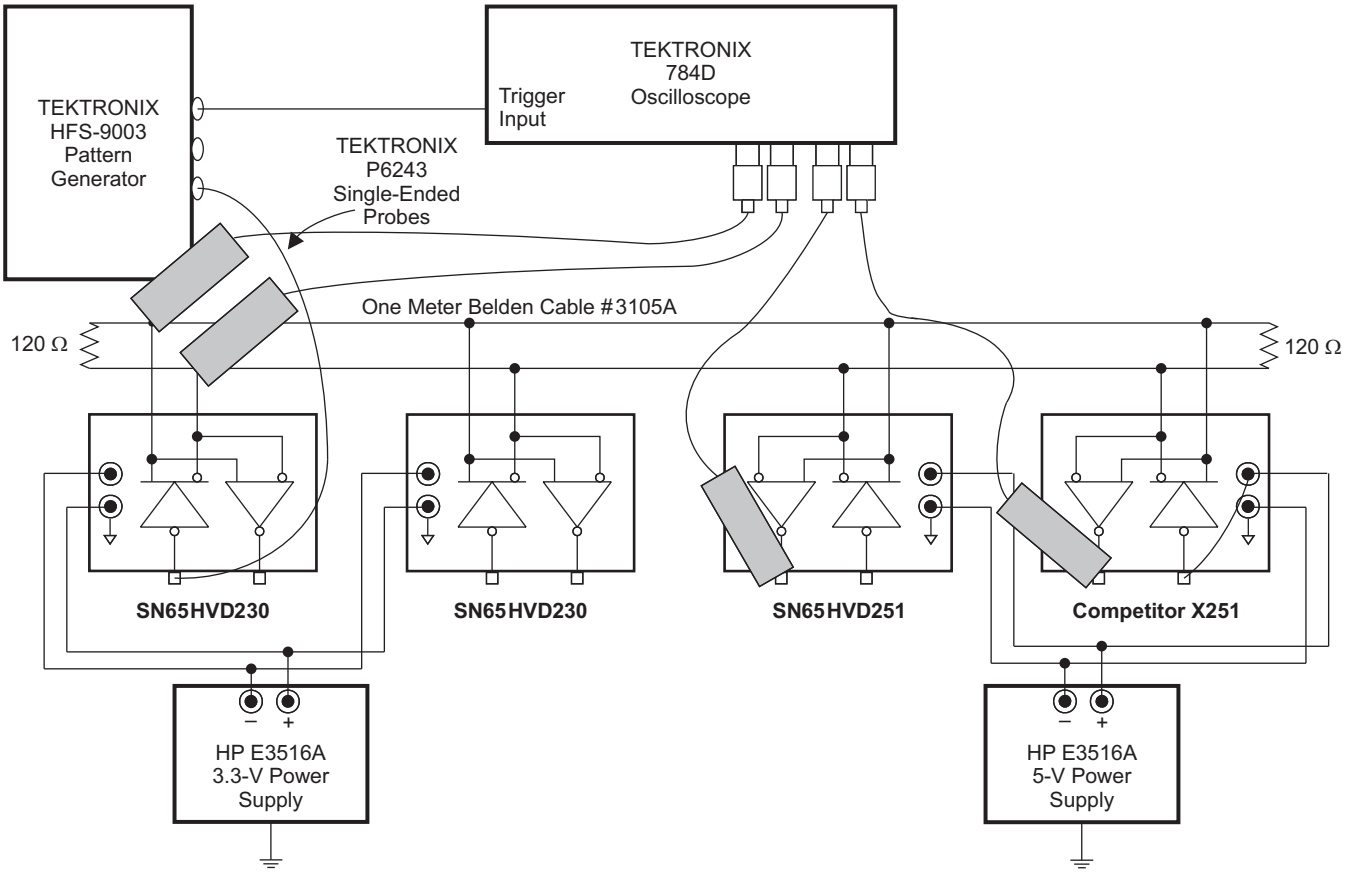

Figure 43. 3.3-V and 5-V CAN Transceiver System Testing

12 Power Supply Recommendations

The SN65HVD23x 3.3 V CAN transceivers provide the interface between the 3.3 V µPs, MCUs and DSPs and the differential bus lines, and are designed to transmit data at signaling rates up to 1 Mbps as defined by the ISO 11898 standard.

To ensure reliable operation at all data rates and supply voltages, the V_{CC} supply pin of each CAN transceiver should be decoupled with a 100-nF ceramic capacitor located as close to the V_{CC} and GND pins as possible. The TPS76333 is a linear voltage regulator suitable for supplying the 3.3-V supply.

13 Layout

13.1 Layout Guidelines

In order for the PCB design to be successful, start with design of the protection and filtering circuitry. Because ESD and EFT transients have a wide frequency bandwidth from approximately 3 MHz to 3 GHz, high frequency layout techniques must be applied during PCB design. On chip IEC ESD protection is good for laboratory and portable equipment but is usually not sufficient for EFT and surge transients occurring in industrial environments. Therefore robust and reliable bus node design requires the use of external transient protection devices at the bus connectors. Placement at the connector also prevents these harsh transient events from propagating further into the PCB and system.

Use V_{CC} and ground planes to provide low inductance. Note: high frequency current follows the path of least inductance and not the path of least resistance.

Design the bus protection components in the direction of the signal path. Do not force the transient current to divert from the signal path to reach the protection device.

An example placement of the Transient Voltage Suppression (TVS) device indicated as D1 (either bi-directional diode or varistor solution) and bus filter capacitors C8 and C9 are shown in .

The bus transient protection and filtering components should be placed as close to the bus connector, J1, as possible. This prevents transients, ESD and noise from penetrating onto the board and disturbing other devices.

Bus termination: Figure 44 shows split termination. This is where the termination is split into two resistors, R7 and R8, with the center or split tap of the termination connected to ground via capacitor C7. Split termination provides common mode filtering for the bus. When termination is placed on the board instead of directly on the bus, care must be taken to ensure the terminating node is not removed from the bus as this will cause signal integrity issues of the bus is not properly terminated on both ends. See the application section for information on power ratings needed for the termination resistor(s).

Bypass and bulk capacitors should be placed as close as possible to the supply pins of transceiver, examples C2, C3 (V_{CC}).

Use at least two vias for V_{CC} and ground connections of bypass capacitors and protection devices to minimize trace and via inductance.

To limit current of digital lines, serial resistors may be used. Examples are R1, R2, R3 and R4.

To filter noise on the digital IO lines, a capacitor may be used close to the input side of the IO as shown by C1 and C4.

Since the internal pull up and pull down biasing of the device is weak for floating pins, an external 1k to 10k ohm pull-up or down resistor should be used to bias the state of the pin more strongly against noise during transient events.

Pin 1: If an open drain host processor is used to drive the D pin of the device an external pull-up resistor between 1k and 10k ohms should be used to drive the recessive input state of the device (R1).

Pin 8: is shown assuming the mode pin, RS, will be used. If the device will only be used in normal mode or slope control mode, R3 is not needed and the pads of C4 could be used for the pull down resistor to GND.

Pin 5 in is shown for the SN65HVD230 and SN65HVD231 devices which have a V_{ref} output voltage reference. If used, this pin should be tied to the common mode point of the split termination. If this feature is not used, the pin can be left floating.

For the SN65HVD232, pins 5 and 8 are no connect (NC) pin. This means that the pins are not internally connected and can be left floating.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

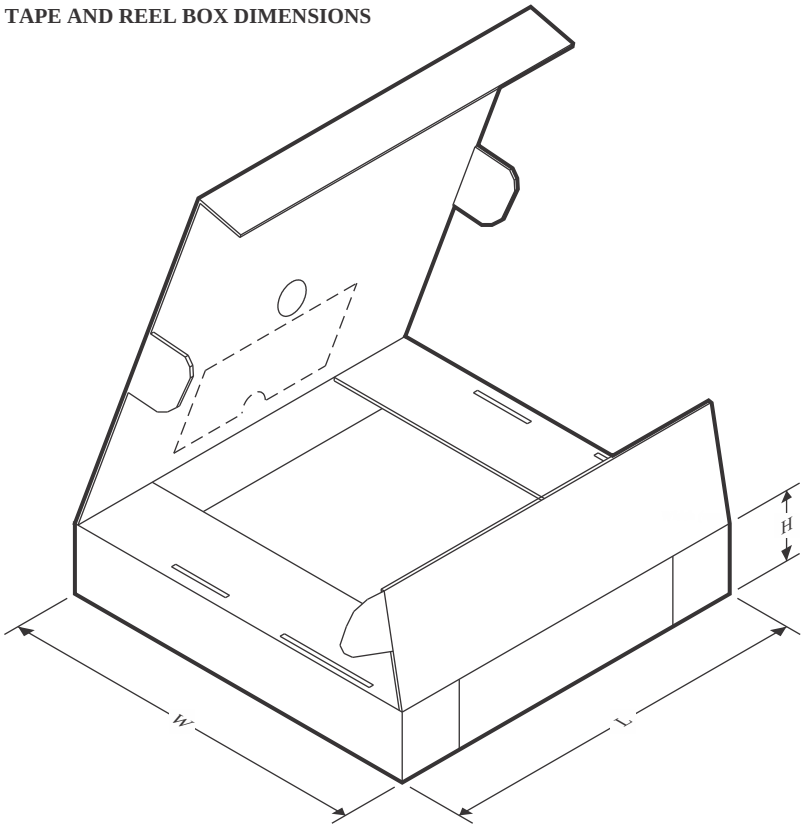
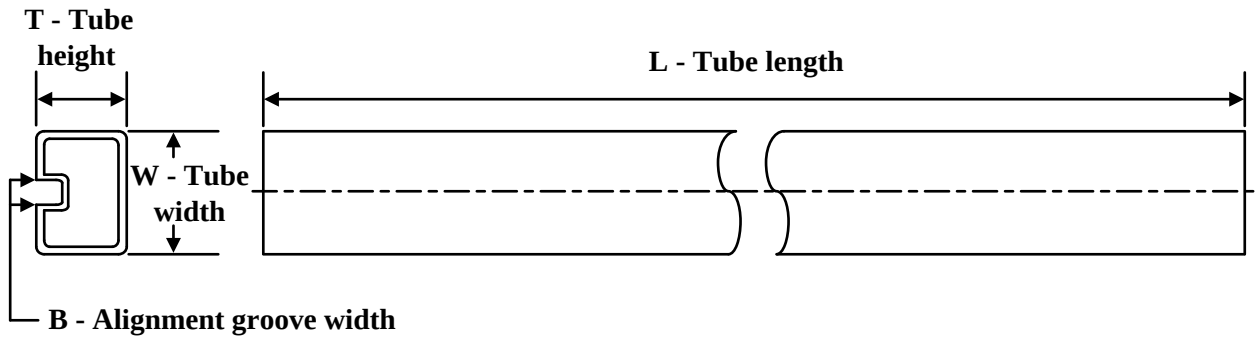
TAPE AND REEL BOX DIMENSIONS



*All dimensions are nominal

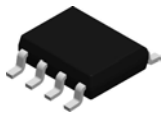
Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
SN65HVD230DR	SOIC	D	8	2500	340.5	336.1	25.0
SN65HVD231DR	SOIC	D	8	2500	340.5	336.1	25.0
SN65HVD232DR	SOIC	D	8	2500	340.5	336.1	25.0

TUBE



*All dimensions are nominal

Device	Package Name	Package Type	Pins	SPQ	L (mm)	W (mm)	T (µm)	B (mm)
SN65HVD230D	D	SOIC	8	75	507	8	3940	4.32
SN65HVD230DG4	D	SOIC	8	75	507	8	3940	4.32
SN65HVD231D	D	SOIC	8	75	507	8	3940	4.32
SN65HVD231DG4	D	SOIC	8	75	507	8	3940	4.32
SN65HVD232D	D	SOIC	8	75	507	8	3940	4.32
SN65HVD232DG4	D	SOIC	8	75	507	8	3940	4.32

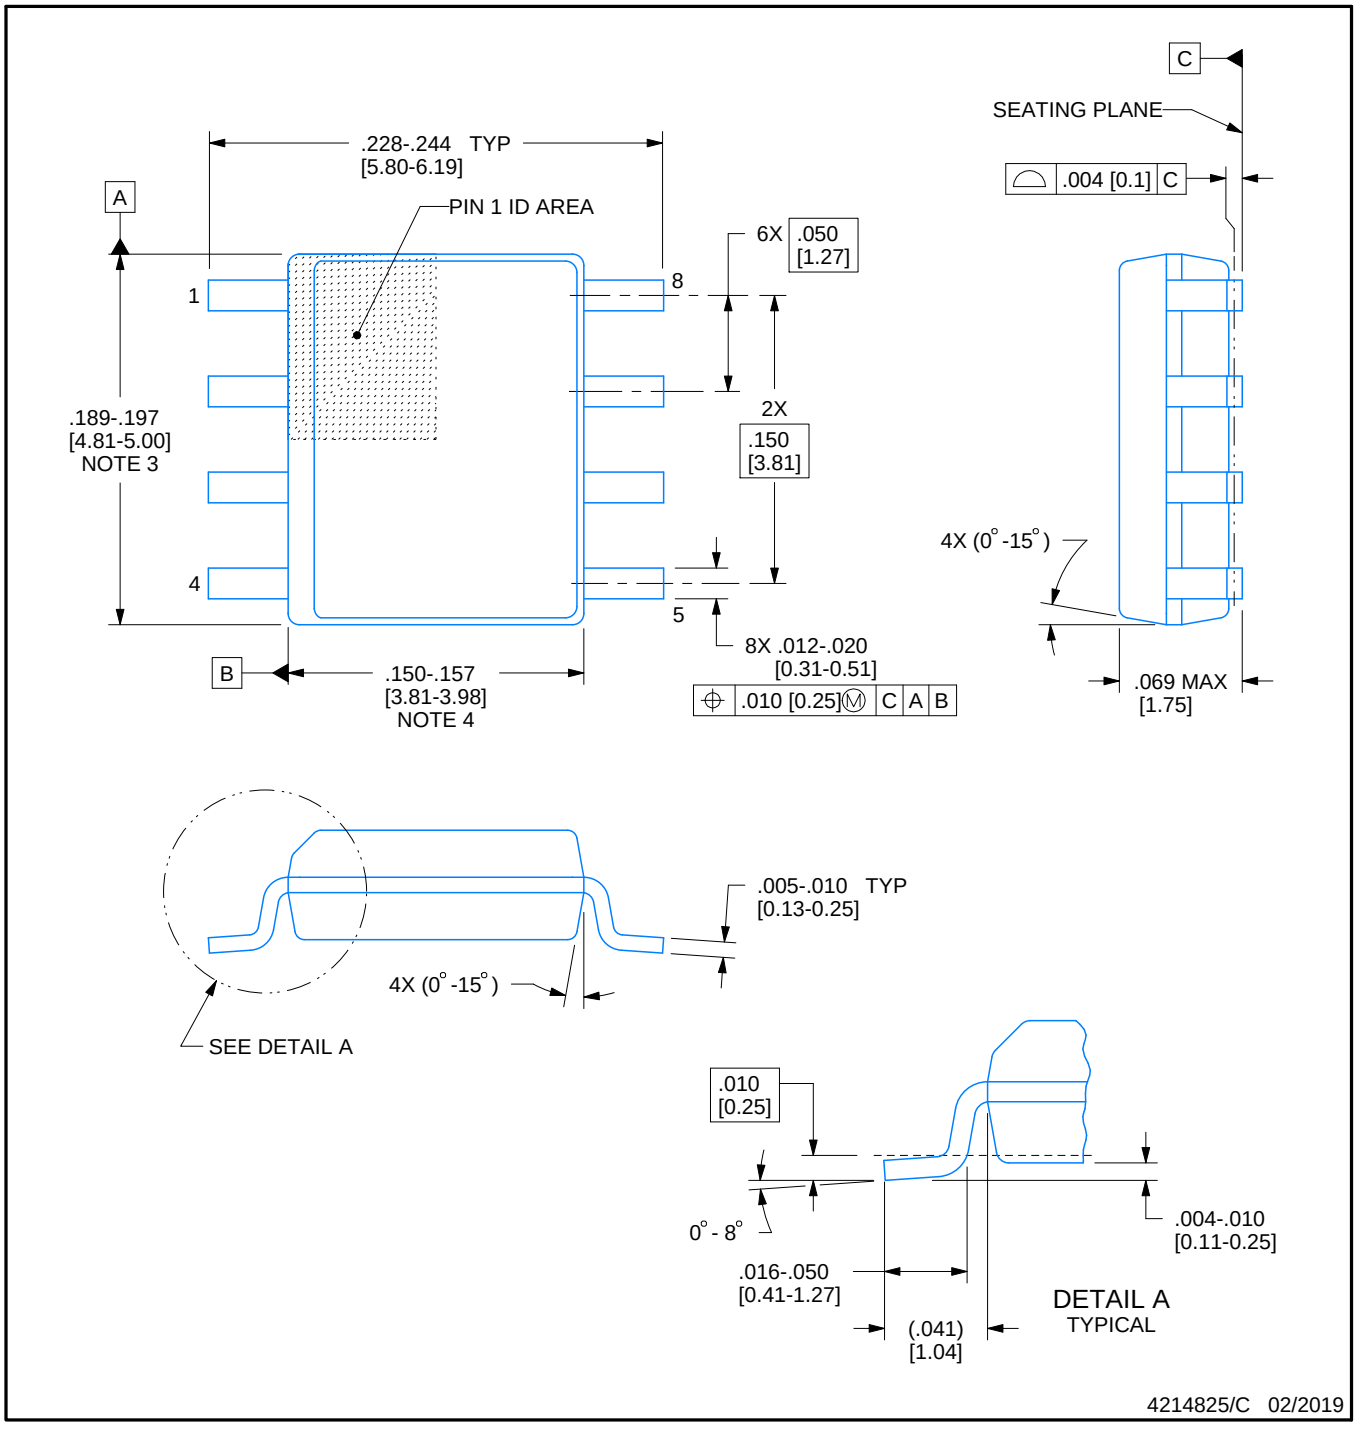


PACKAGE OUTLINE

D0008A

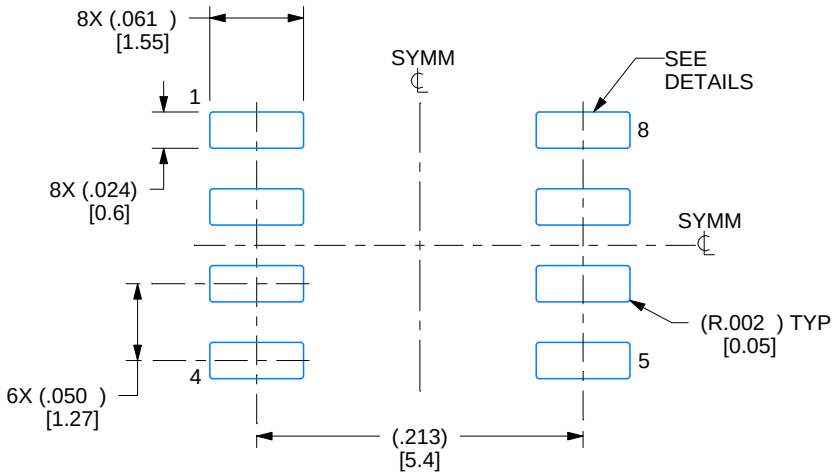
SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

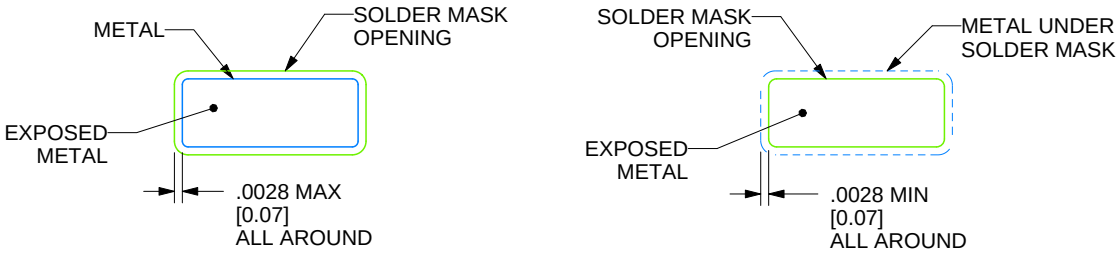


NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:8X



SOLDER MASK DETAILS

4214825/C 02/2019

NOTES: (continued)

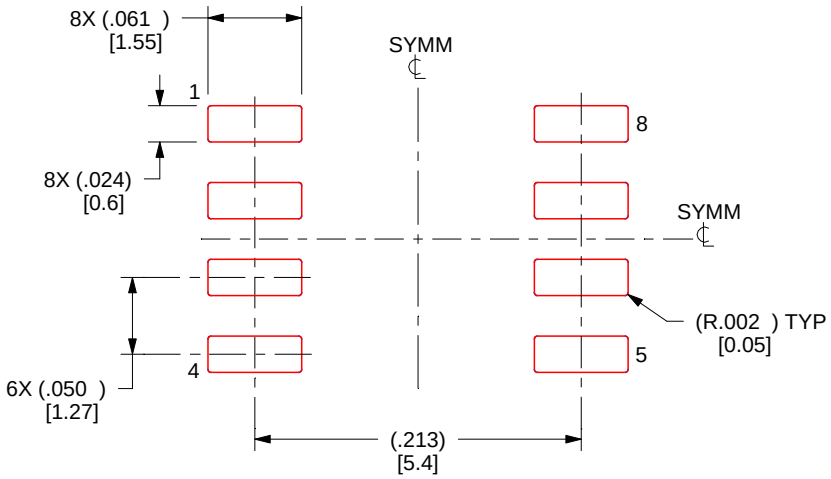
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT



SOLDER PASTE EXAMPLE
BASED ON .005 INCH [0.125 MM] THICK STENCIL
SCALE:8X

4214825/C 02/2019

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

重要声明和免责声明

TI“按原样”提供技术和可靠性数据（包括数据表）、设计资源（包括参考设计）、应用或其他设计建议、网络工具、安全信息和其他资源，不保证没有瑕疵且不做出任何明示或暗示的担保，包括但不限于对适销性、某特定用途方面的适用性或不侵犯任何第三方知识产权的暗示担保。
